

Claims:

1. An integrated circuit comprising:

a two-dimensional pyramid filter architecture of an order $2N-1$, where N is a positive integer greater than two;

said two dimensional pyramid filter architecture of order $2N-1$, in operation, capable of producing, on respective clock cycles, at least the following:

pyramid filtered output signals corresponding to output signals produced by two one-dimensional pyramid filters of order $2N-1$; and

pyramid filtered output signals corresponding to output signals produced either by four two-dimensional pyramid filters or one two-dimensional pyramid filter of order $[2(N-1) - 1]$ using signal sample matrices of order $[2(N-1)-1]$;

wherein the respective output signals in said two dimensional pyramid filter architecture are summed on respective clock cycles of said two dimensional pyramid filter architecture.

2. The integrated circuit of claim 1, wherein N is three; and

wherein said two dimensional pyramid filter architecture of order five, in operation, capable of producing, on respective clock cycles, the pyramid filtered output signals corresponding to output signals produced either by four two-

dimensional pyramid filter or one two-dimensional pyramid of order three using four signal sample matrices $P_{i-1,j-1}^{3 \times 3}, P_{i-1,j+1}^{3 \times 3}, P_{i+1,j-1}^{3 \times 3}, P_{i+1,j+1}^{3 \times 3}$, the pyramid filtered output signals being produced by a plurality of one-dimensional pyramid filters.

3. The integrated circuit of claim 2, wherein said one-dimensional pyramid filters comprise a sequence of scalable cascaded multiplierless operational units, each of said operational units capable of producing a different order pyramid filtered output signal sample stream.

4. The integrated circuit of claim 2, wherein said one-dimensional pyramid filters comprise other than one-dimensional multiplierless pyramid filters.

5. The integrated circuit of claim 2, wherein said two dimensional pyramid filter architecture of order five, in operation, capable of producing, on respective clock cycles, the pyramid filtered output signals corresponding to output signals produced either by four two-dimensional pyramid filters or one two-dimensional pyramid of order three using four signal sample matrices $P_{i-1,j-1}^{3 \times 3}, P_{i-1,j+1}^{3 \times 3}, P_{i+1,j-1}^{3 \times 3}, P_{i+1,j+1}^{3 \times 3}$, the pyramid filtered output signals produced by a plurality of one-dimensional pyramid filters being produced by eight one-dimensional pyramid filters of order three.

6. The integrated circuit of claim 5, wherein, of the eight one-dimensional pyramid filters of order three, four are applied row-wise and four are applied column-wise.

7. The integrated circuit of claim 5, wherein said two dimensional pyramid filter architecture of order five, in operation, capable of producing, on respective clock cycles, the pyramid filtered output signals corresponding to output signals produced by four two-dimensional pyramid filters of order three, the pyramid filtered output signals produced by a plurality of one-dimensional pyramid filters being produced by eight one-dimensional multiplierless pyramid filters of order three.

8. The integrated circuit of claim 7, wherein, of the eight one-dimensional pyramid filters of order three, four are applied row-wise and four are applied column-wise.

9. The integrated circuit of claim 2, wherein said two dimensional pyramid filter architecture of order five, in operation, capable of producing, on respective clock cycles, the pyramid filtered output signals corresponding to output signals produced by four two-dimensional pyramid filters of order three, the pyramid filtered output signals produced by a plurality of one-dimensional

pyramid filters being produced by other than one-dimensional multiplierless pyramid filters.

10. The integrated circuit of claim 1, wherein N is three;
said two dimensional pyramid filter architecture of order five, in operation, being capable of producing, on respective clock cycles, at least the following:
output signals produced by four two-dimensional pyramid filters of order three.

11. The integrated circuit of claim 1, wherein said two dimensional pyramid filter architecture of order five, in operation, capable of producing, on respective clock cycles, the pyramid filtered output signals corresponding to output signals produced by four two-dimensional pyramid filters of order three, the pyramid filtered output signals being produced by two-dimensional pyramid filters other than four two-dimensional pyramid filters.

12. A method of filtering an image using a two-dimensional pyramid filter architecture of order $2N-1$, where N is a positive integer greater than two, said method comprising:

summing, on respective clock cycles of said two dimensional pyramid filter architecture, the following:

pyramid filtered output signals corresponding to output signals produced by two one-dimensional pyramid filters of order $2N-1$; and

pyramid filtered output signals corresponding to output signals produced either by four two-dimensional pyramid filters or one two-dimensional pyramid filter of order $[2(N-1) - 1]$ using signal sample matrices of order $[2(N-1)-1]$.

13. The method of claim 12, wherein N is three;

pyramid filtered output signals corresponding to output signals produced either by four two-dimensional pyramid filters or one two-dimensional pyramid filter of order $[2(N-1) - 1]$ using signal sample matrices of order $[2(N-1)-1]$ comprising output signals produced by four two-dimensional pyramid filters of order three.

14. The method of claim 12, wherein N is three; and

wherein the pyramid filtered output signals corresponding to output signals produced either by four two-dimensional pyramid filters or one two-dimensional pyramid of order three using four signal sample matrices $P_{i-1,j-1}^{3 \times 3}, P_{i-1,j+1}^{3 \times 3}, P_{i+1,j-1}^{3 \times 3}, P_{i+1,j+1}^{3 \times 3}$, comprise pyramid filtered output signals produced by a plurality of one-dimensional pyramid filters.

15. The method of claim 14, wherein said one-dimensional pyramid filters comprise a sequence of scalable cascaded multiplierless operational units, each of said operational units capable of producing a different order pyramid filtered output signal sample stream.

16. An article comprising: a storage medium, said storage medium having stored thereon instructions, that, when executed result in filtering an image using a two-dimensional pyramid filter architecture of order $2N-1$, where N is a positive integer greater than two, by:

summing, on respective clock cycles of said two dimensional pyramid filter architecture, the following:

pyramid filtered output signals corresponding to output signals produced by two one-dimensional pyramid filters of order $2N-1$; and
pyramid filtered output signals corresponding to output signals produced either by four two-dimensional pyramid filters or one two-dimensional pyramid filter of order $[2(N-1) - 1]$ using signal sample matrices of order $[2(N-1)-1]$.

17. The article of claim 16, wherein N is three;

pyramid filtered output signals corresponding to output signals produced either by four two-dimensional pyramid filters or one two-dimensional pyramid

filter of order $[2(N-1) - 1]$ using signal sample matrices of order $[2(N-1)-1]$ comprising output signals produced by four two-dimensional pyramid filters of order three.

18. The article of claim 16, wherein N is three; and

wherein the pyramid filtered output signals corresponding to output signals produced either by four two-dimensional pyramid filters or one two-dimensional pyramid of order three using four signal sample matrices $P_{i-1,j-1}^{3 \times 3}, P_{i-1,j+1}^{3 \times 3}, P_{i+1,j-1}^{3 \times 3}, P_{i+1,j+1}^{3 \times 3}$, comprise pyramid filtered output signals produced by a plurality of one-dimensional pyramid filters.

19. The article of claim 18, wherein said one-dimensional pyramid filters comprise a sequence of scalable cascaded multiplierless operational units, each of said operational units capable of producing a different order pyramid filtered output signal sample stream.

20. An image processing system comprising:

an image processing unit to filter scanned color images;

said image processing unit including at least one two-dimensional pyramid filter architecture;

said at least one two-dimensional pyramid filter architecture comprising:

a two-dimensional pyramid filter architecture of an order $2N-1$, where N is a positive integer greater than two;

said two dimensional pyramid filter architecture of order $2N-1$, in operation, capable of producing, on respective clock cycles, at least the following:

pyramid filtered output signals corresponding to output signals produced by two one-dimensional pyramid filters of order $2N-1$; and

pyramid filtered output signals corresponding to output signals produced either by four two-dimensional pyramid filters or one two-dimensional pyramid filter of order $[2(N-1) - 1]$ using signal sample matrices of order $[2(N-1)-1]$;

wherein the respective output signals in said two dimensional pyramid filter architecture are summed on respective clock cycles of said two dimensional pyramid filter architecture.

21. The system of claim 20, wherein N is three;

pyramid filtered output signals corresponding to output signals produced either by four two-dimensional pyramid filters or one two-dimensional pyramid filter of order $[2(N-1) - 1]$ using signal sample matrices of order $[2(N-1)-1]$ comprising output signals produced by four two-dimensional pyramid filters of order three.

22. The system of claim 20, wherein N is three; and

wherein the pyramid filtered output signals corresponding to output signals produced either by four two-dimensional pyramid filters or one two-dimensional pyramid of order three using four signal sample matrices $P_{i-1,j-1}^{3 \times 3}, P_{i-1,j+1}^{3 \times 3}, P_{i+1,j-1}^{3 \times 3}, P_{i+1,j+1}^{3 \times 3}$, comprise pyramid filtered output signals produced by a plurality of one-dimensional pyramid filters.

23. The system of claim 22, wherein said one-dimensional pyramid filters comprise a sequence of scalable cascaded multiplierless operational units, each of said operational units capable of producing a different order pyramid filtered output signal sample stream.
